

Supporting Appendix S4. The complete dataset used in our study.

N	sequential number of independent samples in the analysis
Family	taxonomic family for sister-clades
Genus	taxonomic genus for sister-clades
Clade.A	the taxa within the first of the two sister-clades; includes only the species or subspecies that fall within the latitudinal region of interest (high or low latitudes - see Latitude below)
Clade.B	the taxa within the second of the two sister-clades; includes only the species or subspecies that fall within the latitudinal area of interest (high or low latitudes - see Latitude below)
Latitude	high or low, based on the species distributions (centroid latitude > 40 degrees = high; centroid latitude between tropics of Cancer and Capricorn = low)
Sympatry	the proportion of the smaller range clade that falls within the distribution of the larger range clade (breeding ranges only); includes only the species that fall within the latitudinal area of interest (high or low latitudes - see Latitude above)
TMRCA	estimated time to most recent common ancestor measured in number of lineages born from a parent lineage per substitution per site
p.Distance	mean raw nucleotide distance (p distance) between members of the two clades, measured using the program MEGA 4
p.Distance.SE	standard error of the mean nucleotide distance (p distance) between members of the two clades, measured using the program MEGA 4 (bootstrap, 1000 replicates)
mtDNA.Genes	genes used to estimate genetic distance
Base.Pairs	number of base pairs used to estimate genetic distance
Rank	mean ranking of color pattern differences across 7 observers, ranging from 0 (similar) to 1 (different); ranked within families; standardized to between 0 and 1
Rating	mean rating of color pattern differences across 7 observers, rated from 1 (similar) to 7 (different); rated within families, standardized within observers within each family (mean = 0, SD = 1.0)

Notes:

data sets include only clades with p distance values between 0 - 0.06

subspecies/allopatric populations are included

incl = lineage includes a taxon whose phylogenetic placement is based on other evidence (e.g., morphometrics, other genes) and for which genetic data for the gene(s) of interest are not available

excluding = lineage excludes a taxon that is sometimes included within a species but is phylogenetically independent based on sequence evidence
